Suafe

What is Suafe? A user friendly interface and cross-platform application, that takes the hassle out of constantly updating server authorization (AUTHZ) files in Subversion. Features: Compatible with most major authentication providers (LDAP, PostgreSQL, Oracle, MySQL, and NIS.) Subversion AUTHZ file can be created from scratch without the need to install any additional software. Suafe provides suggestions when an authz file is out-of-date. A number of different authz type files can be installed, each with their own set of configuration and preferences. You can create as many authz type files as you want, and you can have different sets of files defined for each repository (or global for all repositories.) Suafe is fully configurable. You can define your own authentication provider, set defaults, and decide which authz types are enabled in each repository. You can connect to a legacy SVN server, or the latest and greatest Subversion server (even with SSL support). Suafe provides a full-featured frontend that allows you to customize the authentication experience in many ways. Suafe can be run in either local mode, or as a standalone service. It is designed to work in a stand-alone environment. Suafe does not require a database. Suafe is very efficient. Suafe does not require any unnecessary disk access or file parsing. Suafe uses the Minimal Access Control security model to allow you to easily create new security principals to limit access to your repository. Suafe is a 100% Swing based application. What's New in the Suafe?

Suafe is a Subversion administrator's tool that takes that effort out of manually maintaining Subversion authorization (authz) files. It validates and provides tools for updateing authz files using a Java Swing based GUI. Rate the tool: (Use 5 stars and share your experience with this tool) Comments about version 6.3.x Beta: What's new in version 6.3.x Beta? Support for tag-based authorization (i.e., access decisions can be based on a particular tag) Suafe can work with any Subversion repository that supports the svnserve protocol. Changes made with Suafe can be uploaded back into a Subversion repository. Version 6.3.x Beta Supported server protocols suafe supports both the svnserve and svn(1) protocol(s). Supporting a web server (e.g., Apache) through the http(s) protocol has been tested but it should work fine in your environment. What is Suafe? Suafe is a Subversion authorization tool that takes that effort out of manual maintenance of the permission system. Suafe uses a Swing-based user interface that allows you to check, change, and update authorization files for Subversion repositories. Suafe's authorization system is based upon the Subversion authorization system (authz) and it has been designed to easily integrate with the subversion implementation that you are using. Even before you start using Suafe, it is worth checking out the online documentation which contains extensive information about how the authorization system works and how to configure Suafe to access your repositories. Suafe provides support for standard Subversion files, including files with comments and file locks. Suafe supports the full range of access permissions including read, write, write-lock, modify, lock-permission, delete, and execute. The fact that Suafe's authorization implementation is based on Subversion's authorization implementation gives you a lot of freedom in how you want to use the tool to keep track of permissions. Suafe's authorization system is made to be extensible. You can do this by extending Suafe's permissions model, or by extending the system itself, for example with your own modification to the Subversion file-locking model. As a result, Suafe's extensibility results in a very flexible software package. What is not supported?
